AI-native UX Engineer with 9+ years bridging design and engineering across iOS, Android, and web. Part of the core team that rebuilt DoorDash's cross-platform design system, growing adoption from 40% to 95%, then moved to the product side and shipped on top of what we built together. That dual perspective shapes how to partner with designers, engineers, and product stakeholders to make strong architectural decisions at scale. Brings that lens to cross-functional collaboration, system architecture, and AI-assisted development, using Generative UI, MCP workflows, and Figma MCP to close the gap between design and code.

Work Experience

DoorDash

Nov 2021 - May 2026

Lead Frontend Engineer, Affordability Platform

Remote

- Served as the frontend lead for DoorDash's Affordability team, owning architecture, quality standards, and delivery across a server-driven UI system supporting iOS, Android, and web. Wrote and reviewed RFCs, onboarded incoming engineers, enabled designers to contribute directly to the codebase, and provided cross-functional technical guidance that kept the team moving at scale.
- Founded and led TOAD (Tooling, Optimization, Automation and Developer Experience), a self-directed R&D squad of 5 engineers spanning frontend, backend, and ML. Scoped priorities, ran ceremonies, and shipped two prototypes including the Affordability Carousel Debugger, a Generative UI tool built with React, TypeScript, and Next.js that reduced debugging time by over an hour per issue.
- Contributed to an 8% lift in monthly active users by building affordability experiences for DoorDash's Order Ahead platform using server-driven UI, Figma MCP, and AI-assisted development workflows.
- Expanded scope beyond frontend by owning production backend code across two initiatives: the Affordability Carousel experiment platform and the Affordable Meals migration to a unified Go-based architecture, improving maintainability and long-term platform ownership.

Design Systems Engineer, Prism

Remote

- Part of the core team that rebuilt DoorDash's cross-platform design system, migrating from UIKit to SwiftUI and delivering a unified SDK across three products and acquired platforms. Grew design system adoption from 40% to 95% through modern component architecture, reusable foundations, and improved developer experience, contributing to a 0.8% reduction in hitch rates.
- Eliminated the gap between design intent and production code by introducing headless component architecture across 40+ iOS components, partnering closely with designers to align Figma libraries with production implementations and enable product-specific customization while preserving system standards.
- Modernized the design system tooling ecosystem by introducing Supernova, Figma Code Connect, custom plugins, AI-assisted workflows, and automated quality checks, improving visibility into adoption and implementation status across three products.
- Built an interactive component catalog connecting Figma specifications directly with SDK implementations, reducing new engineer integration time by approximately 40% and improving component discoverability across the team.
- Increased accessibility coverage from 20% to 100% by establishing reusable accessibility patterns, snapshot testing, UI testing, and automated validation workflows across the design system.
- Presented at Figma Schema 2022 on scaling one design system across multiple teams, products, and native platforms, covering design-to-code workflows, component architecture, and cross-functional collaboration at scale.

Greenlight Financial Technology

Feb 2020 - Nov 2021

Software Engineer 2, Design Systems and Product

Remote

- Recognized recurring UI patterns across the product and proactively architected Greenlight's iOS design system from the ground up without a formal mandate, building a reusable component foundation that became the standard for a team of 6 iOS engineers and established design-to-code workflows across multiple product surfaces.

- Served as the sole iOS engineer across both the core product and investment experience, partnering directly with product and design stakeholders to deliver new features and design system components that improved performance, reliability, and implementation consistency across critical financial workflows.
- Reduced customer support contacts by 45% by redesigning the card management and instant card provisioning experience, delivering a streamlined activation flow that helped customers realize value faster from day one.

Lambda School

March 2020 - Aug 2020

iOS Evening Instructor

Remote

- Mentored and trained aspiring iOS engineers through live technical instruction, presentations, and one-on-one coaching, simplifying complex concepts and helping students build confidence in modern mobile development practices.

Wunderman Thompson Mobile

June 2016 – Feb 2020

iOS Developer (Enterprise Client Solutions)

Atlanta, Ga

- Delivered mobile experiences for enterprise clients including NBA/Turner Sports, JetBlue, CNN, and PGA Tour, partnering directly with customer product, design, and engineering teams to translate business requirements into scalable, production-ready applications built with Swift, Objective-C, REST APIs, and cloud-based services.
- Built fan engagement, live-streaming, subscription, and voice experiences for NBA/Turner Sports, contributing to 63% subscriber growth. Rebuilt the NBA Alexa Skill using the latest ASK SDK and developed custom SpriteKit-powered motion experiences, including animated celebration workflows that enhanced fan engagement during live events.
- Developed high-impact customer workflows across travel and media platforms, including a real-time currency conversion experience for JetBlue and ad-enabled playback infrastructure for CNN's flagship mobile app rewrite, contributing to a 25% increase in ad-driven revenue.

Education

Emory University

2017

Bachelor's Degree in Computer Science

Atlanta, GA

Certifications and Skills

- **Full Stack Web Development Certificate** — Georgia Institute of Technology (2018)
- **UX Engineering & Design Systems**
Design Systems, Component Architecture, Headless Component Architecture, Design Tokens, Theming, Accessibility (WCAG), ARIA, Design-to-Code Workflows, Developer Tooling, Prototyping, Interaction Design, Motion Design, Design System Governance
- **Application Development**
React, TypeScript, JavaScript, HTML, CSS, Next.js, Storybook, Swift, SwiftUI, UIKit, Kotlin Multiplatform (KMP), GraphQL, Server-Driven UI, Performance Optimization
- **AI-Native Development**
Generative UI (GenUI), AI-Powered Product Development, Cursor, MCP Workflows, Prompt Engineering, AI-Assisted Development
- **Design Tooling & Collaboration**
Figma, Figma Dev Mode, Code Connect (CLI), Code Connect (UI), Figma MCP, User Research Partnership, Technical Discovery, Product Strategy, Stakeholder Management, Cross-Functional Leadership
- **Data, Testing & Platform Engineering**
SQL, Python, Snowflake, Grafana, A/B Testing, OpenTelemetry, Unit Testing, UI Testing, Maestro, CI/CD, Observability

Speaking & Community

Speaker, Figma Schema Conference (2022) — Presented [Creating DoorDash's Native Mobile Design System](#) to Figma customers and practitioners, focusing on designer-engineer handoff workflows, component architecture, and strategies for scaling design system adoption across mobile teams
